## GENERAL INFORMATION

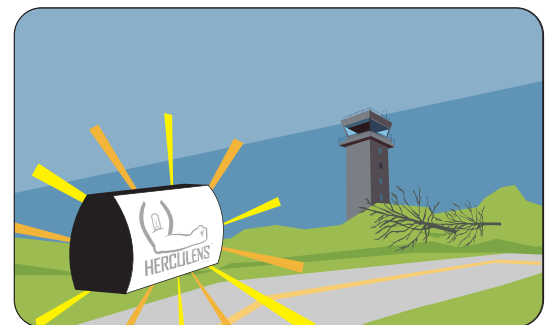

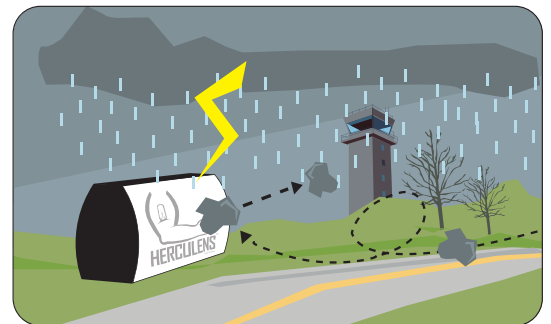

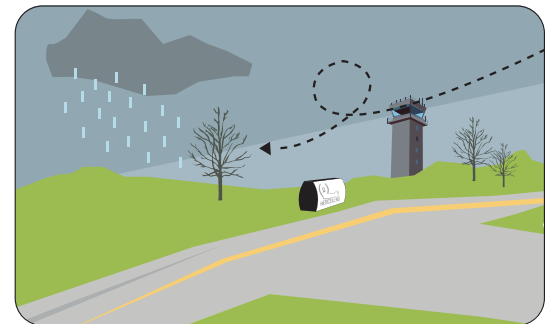

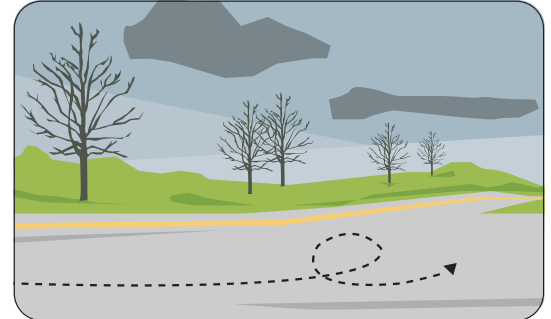

The Herculens is the most durable sign panel on the market today. It comes factory installed in AGM's Size 3 D-Lux brand rounded signs (patent-pending). More than 50% thicker than other panels, it is CNC-machined and expertly formed for a solid fit. The Herculens is unyielding to jet blast, even when used without the flimsy internal bracing or gimmicky cabinet modifications employed by others.

If you have Size 3 Lumacurve® signs that were manufactured between 1991 and 2005, the best and easiest way to make them meet FAA performance specifications is to replace the OEM panels with Herculens panels by AGM. Testing performed or witnessed by Intertek, an FAA 3<sup>rd</sup> Party Certifier, confirms that, without the superior Herculens panels installed, the design used between these dates in the manufacturing of Size 3 Lumacurve® signs will not meet FAA specs.

Of course, the AGM Herculens panel works brilliantly in Size 3 Lumacurve® signs manufactured after these dates, too.

Drawing on its strength as a truly rigid curve, the Herculens has already been demonstrated to and won the approval of, among others, the Massachusetts Port Authority, Los Angeles World Airports, and the Dallas/Fort Worth Department of Aviation.

The use of Herculens panels to upgrade Size 3 Lumacurve® signs has been approved for AIP funding.

Lumacurve is a registered Trademark of Standard Signs
